

MATERIALS INFO

Plated - 18K Gold & Rose Gold

Plated metals are cast in Brass before going through extensive hand polishing to create a smooth surface texture. After being cast, the brass is being underplated with a tin rhodium allow to provide strength and durability.

The designs are then plated with .25 microns (0.00025mm) of the precious metal from your choice. The Brass consists of 15% zinc and 80% Copper

Polished - Bronze

Our bronze goes through extensive hand polishing to give it a smooth finish.

This bronze consists of 10% tin and 90% Copper. Skin safe, transparent nanocoating to the surface is added in order to protect the designs from tarnishing.

Polished - Silver

Our silver is lightly hand polished to achieve a smooth finish, but can still have some surface texture.

It does NOT have a "wet" sheen and highly polished look.

Handling and care

We make sure that each design is handled with care throughout production and packaging.

However, due to the nature of plated and polished metals, it can scratch, wear and tarnish over time.

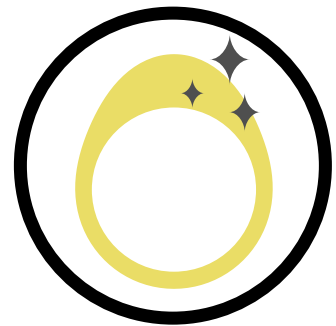

The wearer can prevent damage by storing the item in a soft cloth pouch, away from other products and avoiding exposure to household chemicals/ cleaning products. Polishing may also be required after a certain period of time.
